

Hybrid corridor interpretation from real longitudinal bathymetry

R10 h400 accepted corridor profile with nearshore 2D-to-3D forcing context; no new simulation output

Interpretation: the bed profile is sampled from the accepted h400/R10 corridor; shaded bands are physically motivated regions over that profile. The one-way 2D-to-3D concept is marked at the selected wet interface; the Local3D zone is framework context only.
